To have a complete list of all the available software (and other) that you can download at all times, you should check the direct link to their page in the link's title, as you have done in the following examples: That direct link is: Another good option to know the details of the downloads of the software is to use the 'About' button. You will find all the information about it there. I hope this answer helped you and I wish you good luck in the downloads! [Treatment of upper extremity deep vein thrombosis with low molecular weight heparin: a prospective study of 44 cases]. Deep venous thrombosis is a frequent disease and its complications can cause substantial morbidity and mortality. The treatment of choice is anticoagulation but the optimal regimen has not been determined. Low molecular weight heparins are now available for the treatment of deep venous thrombosis. The aim of this study was to evaluate the efficacy of low molecular weight heparin and to identify factors associated with recurrence of the thrombosis. Forty-four patients with deep venous thrombosis of the upper extremity were included in this prospective study. Low molecular weight heparin was initiated immediately after diagnosis and was administered every day for three months. Clinical evaluation and phlebography were carried out every three months for one year. At the end of the study, the patients were evaluated for thrombolysis, surgery and/or anticoagulant therapy. The main thrombotic risk factors were older than 50 years (81%) and the thrombosis was more than 3 weeks old (53%). There was a significant reduction in the incidence of recurrent thrombosis from 25% to 6% with no statistically significant difference between patients treated with subcutaneous injections (25%) or continuous infusion (7%) of low molecular weight heparin. Recurrences occurred within the first three months after anticoagulation therapy was initiated. Efficacy was significantly higher in women (42% versus 25%) than in men. The recurrence rate was significantly higher in patients with a history of venous thromboembolism (33%) compared with those without (13%). This study demonstrates that the anticoagulation treatment with low molecular weight heparin is effective in the treatment of deep venous thrombosis of the upper extremity. Women had a significantly higher efficacy than men.
