A: You need to compile the C# code into a DLL (and any other code you would want to distribute with the DLL). If you don't do that, the output from your C# code won't be a.DLL that you can then use in a VB6 project. You will need to be able to compile the C# code using the same options as you would use for a normal C# project. Q: MySQL query for elements that exist in multiple tables I have three MySQL tables: Table1 Table2 Table3 Table1 contains some elements, e.g. name, address, phone. Table2 and Table3 contains the corresponding element of each element in Table1. In short: Table1->Table2->Table3 Now I want to select all elements from Table1, that are not in Table2 and are not in Table3, and write them to a csv file. My query looks like this: SELECT * FROM `Table1` WHERE NOT EXISTS (SELECT * FROM `Table2` WHERE `Table1`.`id` = `Table2`.`id`) AND NOT EXISTS (SELECT * FROM `Table3` WHERE `Table1`.`id` = `Table3`.`id`) The problem with this query is that it will return all elements that exist in Table2 and/or Table3, but don't exist in Table1. In other words: if an element exists in Table1, it doesn't exist in Table2 or Table3, but it also doesn't exist in Table1. Is there any way to fix this query? Thanks in advance! A: If you join those two tables to a third table, you can just check for non-matching records, rather than trying to find things that don't exist: SELECT T1.id, T1.name, T1.address, T1.phone FROM `Table1` T1 JOIN `Table2` T2 ON T1.id = T2.id JOIN `Table3` T3 ON T2.id = T3.id WHERE T1.id = T3.id OR T2.id 2d92ce491b
