Stare 07.01.2017 When I
download this file from this

server into a local machine through my web browser, it shows this: I want this file in a machine (like in a server), and I can show this file in my android app that I can make in PHP. A: The problem was solved. First I should know about how to handle cookies for my server. Then I solved this problem: In php, I used `setcookie()` for my webserver and I add the value "1" to this

cookie to obtain a unique number that is returned to the server, when it tries to retrieve the file. In my code, I added a line of code that checks if the received number is the number that I put in this cookie before saving the file.

```
if ($count == '1') { $file_info['unique'] = '1';  
$file_info['content_type'] = 'application/zip';  
$file_info['md5'] = 'd32e454c957ee8812d7a1ecf4b4042d1';
```

```
$file_info['name'] = 'pdfs.zip';  
$file_info['filesize'] =  
filesize($file_path);  
$file_info['filetime'] = time();
```

use `groupby` or `apply` for the
column of datetimes and get the
cumulative sum with `cumsum`
to get all the months. Then,
convert it to month first using
`to_month`, get the diff of month
difference using `month_diff`
and finally `groupby` the
difference column and get the
first row only using `idxmax` and
change the month to the first

```
one of the group. df['datetime']
=
pd.to_datetime(df['datetime'])
df['month_diff'] = df.groupby('
datetime').datetime.apply(lamb
da x: x.month_name() -
x.month_name(0)) df =
df.groupby('month_diff',
sort=False).first()\
.assign(month=lambda x: x['dat
etime'].to_month(x['month_diff
'])) df['month'] =
df['month'].astype(str)
```

```
df['datetime'] =  
pd.to_datetime(df['datetime'])  
>>> df datetime month  
month_diff 2d92ce491b
```
