UltraExtend is a memory utility for DOS and Windows that will allow you to record, analyze and recover lost or corrupted files. WHY DO I NEED IT? Lost data or damaged media is a problem for every user, and we all have encountered situations where data has been lost and we don't know how to get it back. HOW DOES IT WORK? UltraExtend is a powerful memory manager that will not only save your files, but also help you recover lost or damaged data. UltraExtend will recognize when a memory device has reached the end of its lifetime and will clean the memory space before attempting to save a file to the device. When this happens, UltraExtend will save the file somewhere else on your hard disk or another device. UltraExtend has several ways of dealing with corrupted files: • When UltraExtend detects a corrupt file, it will attempt to recover some data from the file and append it to another file. The end result will be two files. • If the file can be successfully recovered, UltraExtend will leave the original intact and rename the recovered file. • If the file cannot be recovered, UltraExtend will delete the original file and use the recovered data as an extension for the replacement file. • UltraExtend will also read the file system to see if there are any bad sectors, as some hard disk manufactures may put data at the end of a track to avoid reading that information. If UltraExtend detects a bad sector, it will simply skip it and continue reading from the beginning of 77a5ca646e

KeyMacro is a sophisticated and powerful utility, which can be used to make your keyboard macros more user friendly. It makes it easy to perform repetitive operations, using the mouse or an external software application to simulate the input from your keyboard. The program can record your keyboard strokes and execute them later when you press the specified key(s). KeyMacro records keyboard strokes in three different modes: 1) simple, 2) repetitive and 3) specialized. The first, simple mode, is designed to capture data from normal text editing or from an external program. You can then edit the data, arrange it according to the order you want to use it in and generate a.reg file. The program then creates a macro file in which the data is compiled. The repetitive mode is designed to capture data from repetitive actions or from an external application. In this mode, you can specify how often the macro should be executed. The specialized mode is designed to capture data from specialized applications or from user interfaces. You can specify which control keys, keys and mouse buttons should be pressed. The program also offers the option to execute a custom macro, and the data captured from that macro can be saved for later use. The recorded macro files can be viewed and modified in a simplified interface. You can also convert the.reg files to.vbs files, and all the files in the macro sequence can be copied to a.reg file. KeyMacro allows you to assign macros to custom keys and also to the following built-in hotkeys: Tabs Enter Shift Tab Ctrl Del Space Ctrl Alt Backspace End Home Arrows Mouse buttons The program features a full undo function, and an option to show the keyboard layout in windows mode.
