## WifiChannelMonitor Crack

WifiChannelMonitor is a network traffic monitoring application that can help administrators obtain important information concerning the available access points and the connected Wi-Fi clients. Alternatively, it can also be used for reading CAP files generated by a third party packet capturing utility. Retrieves data about access points and wireless clients Making use of the Microsoft Network Monitor capture driver, WifiChannelMonitor can retrieve details about Wi-Fi clients that are not connected to an access point, alongside their MAC address, the amount of sent and received data, the device name and its model, the PHY traffic mode (802.11g, 802.11n etc.), as well as security-related information, such as the used key and ciphering algorithm. For all the access points it detects, it displays the SSID and the MAC address, the channel, the PHY type, the number of beacons and received responses, the transferred data, used security algorithm for data encryption and so on. All this is displayed in an organized table, where you can sort all the records by simply clicking on the table headers. Simple configuration and fast identification of active clients WifiChannelMonitor is very easy to configure, thanks to its intuitive options and clear-cut interface. You start by choosing the wireless adapter from the 'Options' area, setting the desired channel and activating the monitor mode. The GUI is split into two separate panes. The first lists the identified access points, whereas the second is dedicated to the Wi-Fi clients detected by the application. Clients that have performed transfers within the last 10 / 60 seconds are marked with green and orange, respectively, while the one that had no activity in the last minute are marked with a red icon. A reliable Wi-Fi monitoring application WifiChannelMonitor can prove useful to any network administrator who wants to keep a close eye on the access points in the network and monitor clients that are trying to initiate a connection. It enables them to view data in real time and generate complete HTML reports that can be quickly shared with other users. WifiReader is an application that displays information on all the Wi-Fi clients in range. It includes a graph that shows the number of wireless devices that are currently on, as well as the duration of their connection in seconds. Additionally, ImDisk is an easy-to-use tool which allows you to explore and manage your disks without any need to be a qualified Windows Administrator. And the best part is that you can use ImDisk with just a single, single click on the Windows desktop. What does ImDisk allow me to do?
